AI CFO for SMEs — Strategy Playbook

Sep 27, 2026 · @Edmir

Summary

We are building **"your company's CFO function, without hiring a CFO"**: an AI agent that sits on top of the accounting systems SMEs already use and delivers management finance to the CEO as finished work.

Decision	Where we landed
Tool or service	Service: we sell the outcome, not software access
Copilot or autopilot	Autopilot for the numbers, copilot for the decisions
Scope	Management finance above the regnskapsfører; they keep the books
Systems	Connect to Tripletex, PowerOffice Go, Fiken (start with Tripletex) plus bank data
Target customer	Labour-heavy SMEs: cleaning, construction, painting
First deliverable	Weekly 13-week cash brief
Pricing model	Fixed monthly fee, tiered; amount still to be tested
Human layer	Human review at onboarding, stepped down as the agent proves itself

Market size (Norway): SAM ~6,350 companies and ~790 MNOK/year; TAM ~41,100 companies and ~5.0 BNOK/year. Details: Market sizing

The Sequoia thesis: services as the new software

Julien Bek's March 2026 piece argues the biggest AI companies will sell finished work, not tools, because every model improvement then makes them cheaper instead of obsolete. Source

The core problem. A company selling an AI tool races the model; the next frontier release can turn it into a feature. A company selling the work gets faster and cheaper with every release.

Framework 1: Intelligence vs. judgement.

- *Intelligence*: rule-based work, even complex rules (coding from a spec, medical coding, filling forms).
- *Judgement*: experience and taste (what to build next, when to ship, strategic calls).
- Software engineering is mostly intelligence, which is why AI took over there first. Other professions follow.

Framework 2: Copilot vs. autopilot.

- *Copilot*: sells the tool to the professional, who owns the output (Harvey to law firms, Rogo to banks).
- *Autopilot*: sells the result to the end customer (Crosby drafts NDAs for the company; WithCoverage sells insurance to the CFO).
- The higher the intelligence share of a field, the sooner autopilots win.

Framework 3: Convergence. Today's judgement becomes tomorrow's intelligence as AI companies gather data on good decisions. Copilots and autopilots eventually merge, but the starting position decides where you win customers first.

The playbook. Roughly six dollars go to services for every dollar spent on software. Start with work that is already outsourced: the customer accepts external delivery, a budget line exists, and they already buy outcomes. A vendor swap is easy; replacing headcount is a reorg. Enter through outsourced intelligence work, then expand into in-house judgement work.

The opening. 2025's fastest-growing AI companies were copilots. Moving to autopilot means cutting out their own customers, the professionals. That innovator's dilemma is the opening for pure autopilots.

Our critical read.

- Strong: the outsourcing wedge, the innovator's dilemma, the intelligence/judgement screen.
- Weak spots: liability is mostly ignored; services margins may land between software and consulting; total-labour-spend market sizes overstate what is capturable; it doubles as a pitch for Sequoia deal flow; "rules are rules" understates judgement at the edges, where cost and risk sit.

Where we sit: service, autopilot for numbers, copilot for decisions

We are a service. How we sell and what we promise decides this, not the technology.

The three-question test.

1. **Who is the buyer?** The SME CEO, not a finance professional. Selling past the professional puts us on the autopilot side.
2. **Which budget do we replace?** Not the software budget. The people budget: the CFO they cannot afford, or extra hours at the regnskapsbyrå.
3. **Who owns the output?** If the CEO must log in, prompt and interpret, we are a tool. If finished outputs arrive every week, we are a service.

The CFO job split by layer.

CFO task	Intelligence or judgement	Mode
Reconciliations, VAT checks, invoice backlog, overdue receivables	Intelligence	Autopilot
Rolling 13-week liquidity forecast	Mostly intelligence	Autopilot
KPI tracking (payroll ratio, margins, budget vs. actual)	Intelligence	Autopilot
Early warnings (e.g. VAT money sitting in the operating account)	Intelligence	Autopilot
Board pack and monthly narrative	Intelligence drafts, judgement frames	Autopilot draft, CEO approves
Pricing a new contract	Mixed	Copilot
Financing, hiring, cost cuts, bank negotiations	Judgement	Copilot, human CFO on call early on

As we collect data on good SME decisions, judgement tasks move into the autopilot column. That is the convergence path.

Positioning and scope boundary

The regnskapsfører keeps the books; we run the finance function on top of them. Most 10–50 person SMEs have bookkeeping but nobody doing management finance. That gap is our wedge: Sequoia's "abandoned work", with no incumbent to displace and nothing regulated to take over.

Pitch line: "You already have someone looking backwards. We look forwards."

The regnskapsfører does (not us)	We do
Bookkeeping, posting vouchers	Liquidity forecast and cash management

The regnskapsfører does (not us)	We do
VAT and payroll reporting	KPI tracking, budget vs. actual
Year-end accounts, tax return	Monthly management pack and board narrative
Statutory responsibility	Early warnings and follow-up actions
	Decision support: pricing, hiring, financing

Why not replace the regnskapsbyrå as the entry point:

- Bookkeeping for others commercially requires authorisation under the regnskapsførerloven (confirm details with Finanstilsynet).
- The market is crowded and commoditised.
- The byrå carries the liability and sign-off, which an AI startup should not hold.

Liability line: we produce analysis and recommendations, not audited accounts or sign-offs.

Avoiding the chat-interface trap

Make chat the least important part of the product. If the chat box disappeared and the customer still got most of the value, we have escaped the trap.

From pull to push. Chat is pull: the CEO must know what to ask and how to read the answer. A service is push: the work arrives unasked. Chat remains only as a way to dig into delivered output.

Five things a chat box cannot replace:

1. **Sell deliverables and commitments.** The contract lists outputs and service levels ("pack by day 5", "no VAT surprises"). Tripletex or Claude cannot promise work on the customer's behalf.
2. **Act, don't just answer.** Chase overdue customers, follow up unapproved supplier invoices, prepare payment runs, draft bank emails. The CEO clicks approve instead of writing prompts.
3. **Capture the company's playbook.** Onboarding turns company-specific rules into a written rulebook: wages paid in arrears, re-invoiced materials, board-approved liquidity floor, bank vs. book balance. This is the core moat.
4. **Sit across systems.** Tripletex's AI sees only Tripletex. We combine ledger, bank, payroll, contracts and pipeline, because the CFO job happens between systems.

5. **Build compounding data.** Across 50 labour-heavy firms we can benchmark ("your payroll ratio is 4 points worse than peers"). Each customer makes the service smarter for the next.

Why likely competitors won't do this well:

- **Tripletex** relies on regnskapsbyråer as a channel. Selling finished CFO work to CEOs competes with its partners.
- **Claude and general models** are capable but don't own outcomes, don't know company rules and don't set themselves up. A technical person can build this with Claude and MCP; our customers can't and won't. The moat is configuration, reliability, accountability and delivery.

Two tests for every feature:

1. If we removed the chat box, would this still deliver value?
2. When the next model ships, do we get better or obsolete?

UX: how the output reaches the CEO

The CEO never goes looking for the product. It finds them, says what matters in under a minute, and lets them act with one tap.

Layer	Channel	What it does
1. Weekly brief (push)	Monday email + mobile app	One phone screen: where we stand, what changed, what needs you
2. Alerts (event-driven)	Push notification or SMS	Only when a threshold is crossed; always with a suggested action
3. Decision queue	App cards, magic links from email	Agent prepares the work, CEO taps approve
4. Monthly pack + reference view (pull)	PDF / shareable doc around day 5; web dashboard	Board-ready pack; dashboard for digging in, where chat lives attached to numbers

Example weekly brief:

```
GREEN - Cash is fine for the next 6 weeks.
Week 7 dips to 1.6 MNOK, below your 2 MNOK floor, unless Customer X pays the
420k invoice due on the 30th.

What changed: Payroll ratio rose to 79% (target 75%), driven by overtime on
the hospital contract.

Needs you (2): Approve reminder to Customer X · Decide on overtime policy for
the hospital contract
```

Example decision card: "Customer X is 45 days late on 212k. Draft reminder ready. [Send] [Wait a week] [I'll call them]"

Design principles:

- Quiet when things are fine: "Nothing needs you this week" builds trust.
- Show data freshness: "Books updated through 14 Sept; 12 supplier invoices not yet posted."
- Every number has a "so what" and a suggested action.
- Mobile first: many CEOs in these trades spend the day on job sites or in the car.
- No-friction access: magic links, no password to approve a reminder.
- A human escape hatch: "talk to your CFO" during the early phase.
- Write like a CFO talks: short, direct, Norwegian, no jargon.

What to measure (not daily active users):

- CEO time per week (target under 10 minutes)
- Share of prepared actions approved without edits
- Problems caught early, e.g. cash dips flagged weeks ahead
- Whether the CEO forwards the monthly pack to the board or bank

Custom analyses and KPIs

The CEO can request custom analyses and KPIs, and the agent helps shape them only where they make financial and business sense. Every conversation must end in something durable: a finished analysis or a KPI that joins the service. Think "emailing your CFO", not "chatting with an AI".

Request flow:

1. CEO asks in plain words ("Is the hospital contract actually worth it?").
2. Agent clarifies like a CFO: what decision is this for, what should be included?

3. Agent proposes a definition (e.g. contribution margin per contract: revenue minus direct payroll, materials, travel; monthly; vs. 75% payroll target).
4. CEO approves or adjusts.
5. Delivered: one-off analysis as a document or model; recurring KPI added to the weekly brief and alerts.

The "does it make sense" gate. Core question: what decision would change if this number moved? The agent pushes back when:

- It is a vanity metric (revenue per employee vs. margin per contract in a payroll-heavy firm).
- It duplicates an existing KPI.
- The data doesn't exist, and suggests a fix (e.g. project codes in Tripletex).
- It won't lead to action; offers a better alternative instead of just refusing.

One-off analysis	Recurring KPI
"Should we bid on this tender?"	"Track margin per contract"
Scenario model, recommendation, key assumptions	Definition, frequency, target, alert threshold
Delivered as a document or model	Added to weekly brief and alerts

KPI card: every custom KPI gets a versioned spec with name, meaning, formula, data source, frequency, target, alert threshold and why it matters.

Guardrails:

- Deterministic calculations: AI interprets and defines; numbers are computed in code or formulas.
- Locked definitions: changes are versioned, never silent.
- Traceability: every number links back to ledger or bank entries.

Entry points (no blank chat box): "track this" / "explain this" on any number, reply to the Monday email, a "request analysis" button, voice notes from the car.

Moat effect: every approved KPI can become a template with benchmarks for the next similar company.

Target customer, first deliverable, pricing, human layer

Target customer: cleaning, construction, painting

These are two cash patterns, so the cash engine needs a contract mode and a project mode.

	Cleaning	Construction and painting
Revenue	Recurring monthly contracts, steady	Project-based, lumpy
Billing	Fixed monthly invoices	A-konto invoicing, final invoice, retention
Customer	Building owner or facility manager	Often a main contractor with long payment terms
Costs	Mostly payroll	Payroll plus large material purchases up front
Seasonality	Low	High, especially outdoor painting in winter

Sales hook for painters: show their February cash in September.

First deliverable: weekly 13-week cash brief

Frequent, obviously useful, already built in practice. After 6–8 weeks the CEO can see the forecast held up, which builds trust.

Pricing: fixed monthly fee, amount to test

Market data: Norwegian regnskapsførere mostly charge 700–1,490 NOK/hour excl. VAT (Fiken). An older Danish source puts interim CFOs at 1,300–1,500 DKK/hour (Azets). Norwegian fractional CFO estimate (unsourced): ~1,200–2,000 NOK/hour, so one day a week is roughly 35,000–50,000 NOK/month.

For a ~20 MNOK revenue company with a 1.5 MNOK target result, that is a third of profit. Use the part-time CFO as the anchor in the pitch, not as the price; aim for 15–25% of it.

Tier	Contents	Starting hypothesis (NOK/month)
Cash	13-week cash brief plus alerts	4,000–6,000
CFO	Adds KPI pack, monthly board pack, decision queue	9,000–12,000

Tier	Contents	Starting hypothesis (NOK/month)
CFO+	Adds custom analyses, tender pricing, quarterly human CFO session	15,000–20,000

Sanity check: the CFO tier is about 0.5% of revenue for a 20 MNOK company. Consider scaling by employees or revenue. Test with the first 5–10 customers; if nobody pushes back, it is too low.

Which budget pays for us: the advisory and external services budget (6700 series, fremmede tjenester), not the software budget. Account numbers are from the standard chart NS 4102 as best recalled; verify against a real chart.

Account	Covers	Relevance
6720 Honorar for økonomisk og juridisk bistand	Financial and legal advisory	Our line: where a fractional CFO is booked
6705 Regnskapshonorar	Bookkeeping fees	Where the byrå's extra advisory hours land today
6790 Annen fremmed tjeneste	Other external services	Fallback
6420 Leie datasystemer	Software (Tripletex, Advise)	Not our line: where tools compete

- In the advisory line we're compared with a 35–50k innleid CFO or byrå hours at 1,000–1,500 NOK/hour, not with ~2.7k software.
- The line is mostly empty in our segment, so we create new spend; the part that exists sits with the regnskapsfører.
- Invoice as "CFO-tjenester / økonomisk rådgivning", not a software licence, and pitch against byrå hours.

Human layer: remove it, but with measurable exit criteria

Goal: once the agent has learned the company's operations, human review falls away. This matters for margins.

Graduation criteria per customer (proposed):

- 4-week-ahead cash forecast within about ±10% for 8 weeks in a row
- Over 90% of prepared actions approved without edits
- No critical errors over a set period

Step down in stages, since learning never fully finishes (new contracts, staff, a first winter, a customer bankruptcy):

1. Onboarding: human reviews everything.
2. Graduated: random samples plus anything the agent flags as uncertain.
3. Mature: exceptions only (first-time events, low confidence, large decisions).

Consider keeping a human CFO option in the CFO+ tier; access to a person helps sell the product.

Integrations, regulatory and strategic questions

Integrations.

- **Accounting systems:** Tripletex, PowerOffice Go and Fiken have APIs. Start with Tripletex, where we have deep experience.
- **Bank data is the harder part.** Real cash comes from the bank, not the ledger. In Norway this goes through open banking (PSD2): our own licence or a partner such as Neonomics or Tink. Check cost and timeline early.
- **Data quality varies.** Books are often weeks behind. The agent must flag it ("44 unprocessed supplier invoices; forecast less reliable until posted"), which is itself useful to the CEO.

Regulatory. Stay above the books to avoid the regnskapsførerloven authorisation requirement. Confirm the boundary with Finanstilsynet.

The strategic fork: the regnskapsfører's role.

Role	Upside	Downside
Channel (byrå resells us as CFO-as-a-service)	Fast distribution through existing client bases	We become a tool sold to professionals again: the copilot model
Competitor	None	Many byråer sell rådgivning and will resist us
Neutral data source (we sell direct to the CEO)	Pure autopilot play, matches the Sequoia logic	Slower customer acquisition

Direct-to-CEO fits the thesis; byrå partnerships are faster. Not decided yet, but this fork defines the company.

Deliverables catalogue

Every deliverable arrives finished, says what it means, and asks for at most a yes/no decision. The CEO's target time is under 10 minutes a week.

Rhythm	Deliverable	Tier	What it contains	CEO action
Onboarding	Company rulebook	All	Payment terms, payroll dates, re-invoicing rules, liquidity floor, seasonality, loans, index clauses	Confirm once in a 30-min call
Onboarding	Finance health check	All	2–3 pages: cash and runway, payroll ratio trend, receivables and concentration, VAT/tax status, data gaps	Read; first proof of value
Onboarding	Clean-up list for the regnskapsfører	All	Unposted invoices, missing project codes, unreconciled accounts	Forward or approve sending
Weekly	Monday cash brief	All	13-week forecast from bank balances; traffic light, lowest point vs. floor, what changed, up to 3 decisions	1–2 min
Weekly	Receivables follow-up	CFO	Overdue invoices ranked by amount and risk, draft reminders	Send / Wait / I'll call
Weekly	Payment run proposal	CFO	What to pay now, what can wait, cash effect	Approve
Monthly	Management pack (day 5–8)	CFO	Result vs. budget, payroll ratio, margin per contract or project, receivables ageing, one-page narrative	Read, forward to board or bank

Rhythm	Deliverable	Tier	What it contains	CEO action
Monthly	Payroll check	CFO	Hours vs. contracts, unusual overtime, missing NAV sick-pay refunds	Confirm or flag
Monthly	Books status note	CFO	How current the books are, what's missing	Forward to regnskapsfører
Quarterly	Rolling reforecast	CFO	Full-year outlook updated with actuals	Read
Quarterly	Contract profitability and price review	CFO+	Winners and losers, price increases from index clauses	Decide
Annual	Next year's budget (Oct–Nov)	CFO	Draft from actuals, contracts, pipeline	Adjust assumptions
Seasonal	Liquidity warnings	All	Holiday pay, VAT and tax deadlines, winter slump for painters	Read
Event	Alerts	All	Cash below floor, late or at-risk customer, payroll ratio breach, VAT money used as operating cash, unusual cost, new contract margin	Act or dismiss
On request	Tender and pricing calculator	CFO+	Price needed for target margin	Use in bid
On request	Scenario analysis	CFO+	Effect of hires, lost customer, investments on cash and result	Decide
On request	Custom KPIs	CFO	Via the request flow in "Custom analyses and KPIs"	Approve definition
On request	Bank and financing pack	CFO+	Numbers, forecast and narrative for a credit line or loan	Send to bank
On request	Talk to a CFO	CFO+	Quarterly session with a human	Book

The Cash tier sells on the health check, the Monday brief and seasonal warnings. Everything else moves customers up to CFO and CFO+.

Delivery and technical architecture

Email is the backbone, the app handles one-tap decisions, SMS is only for urgent alerts. Behind it sit five layers; the AI writes and explains, but never does the arithmetic.

How deliverables reach the CEO

Deliverable	Channel	Format
Monday cash brief	Email + app push	One-screen summary with link
Receivables follow-up, payment run, payroll check	App card, magic link from email	Decision card
Alerts	Push; SMS if urgent	Cause + suggested action
Monthly management pack	Email with PDF + web view	Board-ready document
Books status note	Email to CEO, optionally regnskapsfører	Short note
Health check, rulebook, budget, reviews	Call + PDF or model	Report
Custom KPIs, scenarios, tenders	Reply to email, app button, voice note	Document or model
Bank pack	PDF or data room link	Document bundle

All in Norwegian and readable on a phone. The product works even if the CEO never installs the app.

Layer 1: Data sources

Source	Gives	Phase	Notes
Tripletex API	Ledger, invoices, receivables, payables, projects, payroll, VAT	MVP	Best API; MCP server in beta
Bank data via PSD2 aggregator (e.g. Neonomics, Tink, Enable Banking)	Actual balances and transactions	MVP	Check price per connection and licence needs
Brønnøysundregistrene (Enhetsregisteret)	Company info, bankruptcy flags	MVP	Free, open
PowerOffice Go API	Second-largest SME system	Phase 3	Likely partner agreement
Visma (eAccounting, Visma.net)	Large share via accountants	Phase 3	Separate APIs per product
Fiken API	Smaller companies	Later	Below core segment
SSB API	Wage and price indices for index clauses	Phase 3	Free
Norges Bank API	Interest rates for scenarios	Phase 3	Free
Credit data (e.g. Creditsafe)	Customer credit scores	Phase 3	Paid

Deliberately avoided at first: Altinn/Maskinporten (the numbers are already in the accounting system), NAV directly (track refunds via ledger accounts), and executing payments (prepare only; CEO approves in the bank).

Layers 2–5

- **Data platform:** Postgres with one common data model across accounting systems; sync jobs (bank daily, ledger several times a day); versioned company rulebook and KPI definitions.
- **Calculation engine (deterministic code, e.g. Python):** 13-week cash engine with contract mode and project mode, KPI calculations, alert thresholds, scenario and pricing models. Tested and auditable.

- **AI layer:** a language model (e.g. Claude via API) writes briefs and narratives, explains movements, drafts reminders, handles custom requests. Orchestration decides what to fetch and when a human reviews. Automatic check that every number in the text matches the engine.
- **Delivery and actions:** transactional email (Postmark, Resend, SendGrid), mobile app with push (React Native/Expo), SMS (Twilio or Link Mobility), server-side PDF, magic links plus BankID via Signicat or Criipto for sensitive actions, job scheduler, and reminders sent through the customer's accounting system so they follow debt-collection rules and appear in the books.

Security and compliance

- Data processing agreements with every customer and sub-processor (hosting, AI provider, email).
- EU/EEA hosting; AI provider set up with no training on customer data.
- Read-only tokens where possible, encryption, full audit log.
- Restrict access to individual salaries.
- ISO 27001 or SOC 2 later, for larger customers or accounting-firm channels.

Build order

Phase	Build	Enables
MVP	Tripletex + bank aggregator + Brønnøysund, cash engine, email brief, simple web app, human review	Cash tier
Phase 2	KPI engine, monthly pack PDF, app with push, decision cards, reminders via Tripletex	CFO tier
Phase 3	PowerOffice + Visma, scenarios and pricing, SSB indices, credit data, benchmarks	CFO+ tier, larger market

Company memory

The agent keeps a growing memory of how each company works, so analysis gets sharper every week. It is the onboarding rulebook made into something that keeps learning, and the strongest moat: software can be copied, two years of knowledge about one company cannot.

What it remembers

Type	Examples	Used by
Operating rules	Wages paid on the 10th, a month in arrears; Tingstad materials always re-invoiced; 2 MNOK floor	Calculation engine (structured)
Customer and supplier behaviour	A customer always pays 10–15 days late; hospital contract indexed every January	Cash forecast, alerts (structured)
Explanations of past events	March payroll spike was a one-off job; varekostnad rose due to supplier consolidation	AI analysis (text)
Goals and preferences	75% payroll target; reminders only after 14 days; no alerts under 20k	Thresholds, tone (structured)
Decisions and outcomes	Didn't renew contract X at 4% margin; raised prices 6%, one customer left	Recommendations (text)

Rules that change numbers must be structured settings the engine reads, never just a sentence the AI might misread.

How it learns

1. **Conversation:** the CEO says something; the agent proposes a memory entry to save, edit or reject.
2. **Data patterns:** the agent notices behaviour (e.g. average days late) and asks before using it.
3. **Reactions:** repeatedly dismissed alerts or edited drafts lead to a proposed new standard.
4. **Documents:** contracts, minutes and price lists are extracted into entries for approval.

Nothing that changes numbers or alerts becomes memory without CEO confirmation.

How it is used

- Before calculating: the engine loads the structured rules.
- During analysis: the AI gets relevant memories and checks for known explanations before raising alarms.
- In the text: explanations reference what it knows ("excluding the seasonal staffing you mentioned, payroll ratio is 77%").

Keeping it trustworthy

- A "What we know about your company" page where the CEO can see, edit and delete every memory.
- Source and date on every entry; status confirmed, suggested or outdated.
- Quarterly re-checks against data; conflicts are flagged, never silently resolved.
- Version history, and the agent may challenge a memory rather than just agree.

Technical design

Component	What	Purpose
Structured memory	Postgres tables with typed fields, validity dates, source, status	Feeds the engine
Narrative memory	Text entries tagged by topic, period, account, customer	Feeds the AI
Retrieval	By tag and period first, semantic search (e.g. pgvector) when needed	Keeps context focused and cheap
Extraction step	AI proposes entries after conversations and uploads	Turns talk into memory
Approval queue	Pending entries await CEO (or reviewer) confirmation	No unverified memory affects numbers
Audit log	Every read and write	Traceability

- **Strict isolation per customer.** Benchmarks come from a separate, anonymised, aggregated layer, stated in the customer agreement.
- **Privacy:** no health, sick-leave reasons or personal matters about employees; store only the business consequence.

Phasing: MVP = structured memory and an editable page. Phase 2 = learning from conversations and dismissed alerts, approval queue, narrative memory. Phase 3 = inferred patterns, document extraction, cross-customer benchmarks.

Sales angle: competitors' AI starts from zero with each question; ours gets better every week, which raises switching costs over time.

Open questions and next steps

Open questions:

- Relationship to Phronesis: same product or separate?
- Channel strategy: direct to CEO, via regnskapsbyråer, or both?
- Actual price points per tier.
- Open banking route: own licence or partner?
- Exact regulatory boundary with Finanstilsynet.

Next steps:

- [ ] List the first 10 target companies (cleaning, construction, painting)
- [ ] Draft questions for the first customer conversations to test the cash brief and pricing
- [ ] Mock up the Monday brief and the decision queue
- [ ] Scope the 13-week cash engine for both contract and project modes
- [ ] Check bank data access: aggregator choice, price per connection, own licence or theirs
- [ ] Confirm the regnskapsførerloven boundary
- [ ] Check Tripletex partner terms for third-party API access
- [ ] Add Visma to the integration plan
